5. User Interface (Optional)

Creating a GUI in MATLAB for users to input parking commands, view system status, and monitor vehicle movement.

Step-by-Step Implementation of the MATLAB Code for Parking System

Step 1: Designing the Parking Lot Layout

Begin by modeling the parking environment. Use MATLAB's plotting tools to define boundaries, parking slots, and pathways.

```
% Example MATLAB code snippet for layout

figure;

hold on;

axis equal;

% Draw parking slots
```

```
for i = 1:5

rectangle('Position',[i2, 1, 1.8, 3],'FaceColor',[0.8 0.8 0.8]);

rectangle('Position',[i2, 5, 1.8, 3],'FaceColor',[0.8 0.8 0.8]);

end

% Draw pathways

rectangle('Position',[0, 0, 12, 1],'FaceColor','white');

rectangle('Position',[0, 7, 12, 1],'FaceColor','white');

hold off;
```

Step 2: Vehicle and Obstacle Detection

Use simulated sensors to detect vehicle positions and obstacles. Image processing techniques like edge detection or color segmentation can be applied for real camera inputs.

Step 3: Path Planning Algorithm

Implement algorithms like A to compute the shortest path.

```
% Example pseudocode for A path planning

start_point = [x_start, y_start];

goal_point = [x_goal, y_goal];

path = AStarSearch(environment_map, start_point, goal_point);
```

The A algorithm considers obstacles and finds an efficient route.

Step 4: Vehicle Movement Control

Create control commands to guide the vehicle along the path.

```
% Simplified control loop
```

for each waypoint in path

compute_heading(current_position, waypoint);

move_vehicle();

update_position();

end

Use MATLAB?s plotting functions to animate the vehicle's movement.

Step 5: Integration and Simulation

Combine all components into a cohesive simulation, allowing the vehicle to navigate from start to parking space autonomously.

Sample MATLAB Code Snippet for a Basic Parking System

Below is a simplified version of MATLAB code illustrating the core logic:

% Initialize environment

parkingLot = zeros(10, 15); % 0 indicates free space

% Define parking spots

parkingLot(3:5, 2) = 1; % Spot 1 occupied

parkingLot(3:5, 4) = 0; % Spot 2 free

% Vehicle starting position

vehiclePos = [1, 1];

% Target parking spot

targetSpot = [4, 4];

% Path planning (using A or other algorithms)

```
path = planPath(parkingLot, vehiclePos, targetSpot);

% Vehicle movement simulation

for i = 1:length(path)

plotVehicle(path(i,1), path(i,2));

pause(0.5);

end

function path = planPath(lot, startPos, endPos)

% Implement path planning logic here

% Return a sequence of points from start to end

end

function plotVehicle(x, y)

% Visualize vehicle at position (x, y)

plot(x, y, 'ro', 'MarkerSize', 8, 'MarkerFaceColor', 'r');

end
```

This code is a foundational starting point that can be expanded with more advanced path planning, obstacle avoidance, and real-time control features.

Automatic Car Parking System Project MATLAB Code: A Comprehensive Guide

Introduction

Automatic car parking system project MATLAB code is a sophisticated solution designed to streamline the parking process, enhance space utilization, and improve overall efficiency in parking facilities. As urban areas become increasingly congested, the demand for intelligent parking management systems has surged. MATLAB, renowned for its powerful computational and simulation capabilities, offers an ideal platform for developing and testing such automated solutions. This article delves into the technical intricacies of implementing an automatic parking system using MATLAB, highlighting its architecture, key components, and the underlying code structure.

Understanding the Need for an Automatic Car Parking System

Before exploring the MATLAB code, it's essential to comprehend why an automated parking system is a pivotal innovation:

- Space Optimization: Efficiently utilizes limited parking space by automating vehicle placement.
- Time Savings: Reduces the time drivers spend searching for parking spots.
- Enhanced Safety: Minimizes human error during parking maneuvers.

- Operational Efficiency: Automates entry/exit processes, billing, and space management.

Core Components of an Automated Parking System

An automated parking system generally comprises several interconnected modules:

- Sensor Array: Detects vehicle presence and measures space availability.
- Control Unit: Processes sensor data and makes decisions.
- Actuators: Execute movements like parking, retrieving, and guiding vehicles.
- User Interface: Allows drivers to interact with the system.
- Mapping and Navigation: Guides vehicles to designated spots.

In MATLAB, these components are simulated, modeled, and controlled through code, emphasizing the importance of a robust algorithmic foundation.

Architectural Overview of the MATLAB-Based System

The MATLAB implementation typically involves:

- Simulation Environment: Visual representation of the parking lot.
- Decision-Making Algorithm: Logic to assign parking spots based on real-time data.
- Path Planning: Calculating optimal routes for vehicles.
- Control Commands: Emulating actuator movements.
- User Interaction Module: Input and output interfaces for drivers.

This modular approach ensures clarity, ease of testing, and adaptability.

Developing the MATLAB Code for an Automatic Parking System

- Setting Up the Environment

Start by defining the parking lot grid:

```matlab

% Define parking lot dimensions

rows = 5; % Number of parking rows
```

cols = 10; % Number of parking spots per row

parkingLot = zeros(rows, cols); % 0 indicates empty spot

```

This matrix represents the parking layout, where each element indicates the status of a parking spot.

- Simulating Vehicle Entry and Spot Allocation

Create a function to assign spots dynamically:

```matlab

function [spotRow, spotCol] = assignParkingSpot(parkingLot)

[rowIdx, colIdx] = find(parkingLot == 0);

if isempty(rowIdx)

disp('Parking is full.');

spotRow = -1;

spotCol = -1;

return;

end

% Assign the first available spot

spotRow = rowIdx(1);

spotCol = colIdx(1);

parkingLot(spotRow, spotCol) = 1; % Mark as occupied

end

```

This code searches for the first free spot and updates the parking lot matrix.

- Path Planning and Navigation

Calculate the shortest route from entrance to assigned spot:

```matlab
% Define entrance position
entrance = [0, 0];
% Path planning function
function route = calculatePath(startPos, endPos)
% Simple Manhattan distance for grid movement
route = [startPos; endPos];
end
```

In complex scenarios, A or Dijkstra algorithms can be implemented for optimal pathfinding.

- Simulating Vehicle Movement

Use graphical plotting to visualize vehicle movement:

```matlab
figure;
hold on;
axis([0 cols 0 rows]);
```
```

```
xlabel('Parking Lot Width');

ylabel('Parking Lot Length');

title('Automatic Parking System Simulation');

% Plot parking spots

for r = 1:rows

for c = 1:cols

if parkingLot(r,c) == 0

plot(c, r, 'gs', 'MarkerSize', 10, 'MarkerFaceColor', 'g'); % Empty

else

plot(c, r, 'rs', 'MarkerSize', 10, 'MarkerFaceColor', 'r'); % Occupied

end

end

end

% Simulate vehicle movement

vehiclePlot = plot(entrance(2), entrance(1), 'bo', 'MarkerSize', 8, 'MarkerFaceColor', 'b');
```

Update vehicle position along the route:

```matlab
for step = 1:size(route,1)

set(vehiclePlot, 'XData', route(step,2), 'YData', route(step,1));

pause(0.5); % Pause for visualization
```

```
end
```

- User Interface and Interaction

Implement simple input prompts:

```matlab
disp('Welcome to the Automated Parking System');
choice = input('Press 1 to park a vehicle: ', 's');
if choice == '1'
[row, col] = assignParkingSpot(parkingLot);
if row ~= -1
start = [0, 0]; % Entrance point
endPos = [row, col];
route = calculatePath(start, endPos);
% Proceed with movement simulation
end
end
```

- Complete System Loop

Wrap the process into a loop for continuous operation:

```matlab
```

```
while true

choice = input('Press 1 to park, 2 to exit: ', 's');

if choice == '1'

[row, col] = assignParkingSpot(parkingLot);

if row ~= -1

route = calculatePath([0,0], [row, col]);

% Visualize movement

end

elseif choice == '2'

disp('Exiting system.');

break;

else

disp('Invalid input.');

end

end
```

Enhancing Functionality and Realism

While the above code provides a foundational simulation, real-world systems require additional features:

- Sensor Data Integration: Simulate sensors to detect vehicle presence dynamically.
- Advanced Path Planning: Implement A, Dijkstra, or RRT algorithms for optimal navigation.
- Dynamic Slot Management: Handle multiple vehicle entries and exits concurrently.

- User Authentication: Incorporate driver data for personalized services.
